↓

Provide set of K pseudo-random m-sequences $PN(t; k)$ ($k=1, \dots, K; K \geq 1$) satisfying convolution signal orthogonality 71

↓

Append a selected sequence $PN(t; k)$ to at least one signal frame to form a padded signal frame 72

↓

Transmit at least one padded signal frame through a transmission channel having an uncontrollable signal time delay 73

↓

Receiving a received version $R_c(t)$ of the transmitted signal and forming a sum $R_c(t; \Delta t; \text{comp})$ of convolution signals $PN(t + \Delta t; k) * R_c(t)$ for $k_1 \leq k \leq k_2$ with $1 \leq k_1 \leq k_2 \leq K$ 74

↓

Forming a remainder signal $R_c(t; \text{rem}) = R_c(t) - R_c(t; \Delta t; \text{comp})$. 75

↓

Analyze remainder signal to determine at least one time at which at least one of the sequences $PN(t; k)$ begins or ends in the received signal $R_c(t)$ 76
